

E-Commerce Sales Dashboard

Professional Power BI Project Report

1. Project Overview

This Power BI dashboard was developed to analyze e-commerce sales performance and business metrics including sales amount, profit, quantity sold, customer behavior, payment trends, and category performance.

2. Business Objective

The objective is to monitor sales performance, identify profitable categories and sub-categories, understand customer purchasing behavior, and analyze payment mode preferences to support business decision-making.

3. Dataset Overview

Two CSV datasets were used: Orders dataset (1500 records) for order/customer details and Details dataset (500 records) for product, category, quantity, and payment information.

4. Dashboard Overview

5. KPI Analysis

- Total Sales Amount: 438K
- Total Profit: 37K
- Total Quantity Sold: 5615
- Average Order Value (AOV): 121K

6. Dashboard Insights

- State-wise sales performance highlights regional contribution patterns.
- Clothing contributes the highest quantity share (63%), followed by Electronics (21%) and Furniture (17%).
- Profit remains relatively stable across months.
- COD is the most preferred payment mode (44%), followed by UPI (21%).
- Printers and Bookcases are the most profitable sub-categories.
- Customer purchase behavior indicates diversified buying across customers.

7. Key Findings

The business shows strong contribution from Clothing products and COD payments dominate customer preference. High-profit sub-categories indicate potential focus areas for business growth.

8. Conclusion

The E-Commerce Sales Dashboard provides a clear view of business performance and supports data-driven decision making using interactive visualizations and KPI tracking.
